

This updated flow strengthens the pitch by keeping the focus on **educational continuity after disruption**, not on logistics or curriculum redesign alone. The core value of Tudlo is that it helps teachers preserve the exact lesson position of their class, recover faster after disruptions, and generate a realistic catch-up plan that can also account for **downtime length**. Typhoons remain the primary MVP case because they can be supported by weather-based disruption detection, but the system stays open to all other disruptions.

The broader support layer is now framed more carefully: instead of presenting mission teacher deployment as an immediate MVP outcome, Tudlo can surface **classes and schools that may need additional support**, with mission teacher deployment treated as a **future DepEd-level roadmap feature**.

1. Updated Detailed Flowchart

	per subject, preserved notes, and catch-up options	
PHASE 5	RECOVERY PERIOD	
	Daily tracking continues, recovery rate is monitored, at-risk subjects are flagged, and refresher coverage is recommended when downtime is long enough to justify it	
PHASE 6	SUPPORT PRIORITIZATION	
	Aggregated disruption and recovery data can be shown on school or division views to identify classes needing support. Future DepEd workflows may use this data for deployment decisions	

2. Simplified Flow (For Your Deck / Script)

Teacher tracks progress

A disruption interrupts classes

Tudlo saves the class's last learning position

School reopens

Teacher receives the exact resume point, catch-up plan, and refresher recommendation if needed

Tudlo highlights classes that may need support

School or DepEd prioritizes intervention using recovery data

Teaching continuity improves and learning gaps are reduced

3. Pitch Flow (For Your Deck / Script)

[ TRACK] → [ PAUSE] → [ RESUME] → [ RECOVER]

4. Why This Version Is Stronger

1. It keeps **typhoons as the primary MVP trigger** because they can be linked to automated weather-based prompts.
2. It preserves the broader scope for **all disruptions**, so the product is not overfit to one case.
3. It reflects the actual implementation better: **manual teacher tracking first**, then **resume instructions**, then **downtime-aware catch-up and refresher support**.
4. It keeps **support prioritization** as the real near-term macro outcome, while treating **mission teacher deployment** as a future roadmap item rather than an immediate feature.
